Short lab report on the Nuclear decay

Alexander Zhuk

February 6, 2016

Date Performed: February 3, 2016 Partners: Whole class Instructor: Me

1 Objective

The objective of this following lab is to learn about the nuclear decay.

2 Nuclear Decay

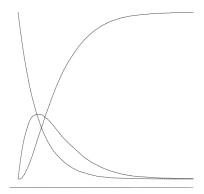

Nuclear Decay is the process by which a nucleus of an unstable atom loses energy by emitting radiation. A material that spontaneously emits such radiation which includes alpha particles, beta particles, gamma rays and conversion electrons is considered radioactive.

3 Simulation

Our teacher created a java program that can simulate the nuclear decay. The first thing that we had to do was to input the initial number of atoms in the terminal. I put 10000. Secondly, we had to put the probability of the decay for A to B. I put 0.1. Thirdly, we were supposed to input the probability of decay for B to C. I put 0.1.

```

```

With the help of this program we were able to recieve the graph for the nuclear decay.

4 Nuclear decay half-life estimations

$$A = Aoe^{-\lambda t}$$

Lambda is a decay constant

$$\frac{A}{Ao} = \frac{1}{2} = e^{-\lambda(T\frac{1}{2})}$$

$$ln\frac{1}{2} = -\lambda(T\frac{1}{2})$$

$$T\frac{1}{2} = \frac{ln(2)}{\lambda}$$

We can use these formulas to find the half life of the Nuclear Decay. By conducting the following estimations I found that the if the probability decreases twice the half life decreases too. So its behaviour is easy to predict.

if the probability of the decay is 0.01 the half life is 69.3 days.

if the probability of the decay is 0.02 the half life is 34.65 days

if the probability of the decay is 0.04 the half life is 17.33 days

if the probability of the decay is 0.08 the half life is 8.66 days

if the probability of the decay is 0.16 the half life is 4.33 days All of these leads us to a conclusion that on average the decay decrease with the same rate. It decreases twice.

5 Discussion

As we can see through this graph that is an exponential function. Consequently, it decays exponentially as it turns into a different form (radiation) per particular time. The decay gets lower and lower. Consequently, the rate gets smaller too. Moreover, a rate of decay is proportional to its origin. An atom looses its initial energy by emitting radiation.
